German electricity production and spot prices in week 4/2017

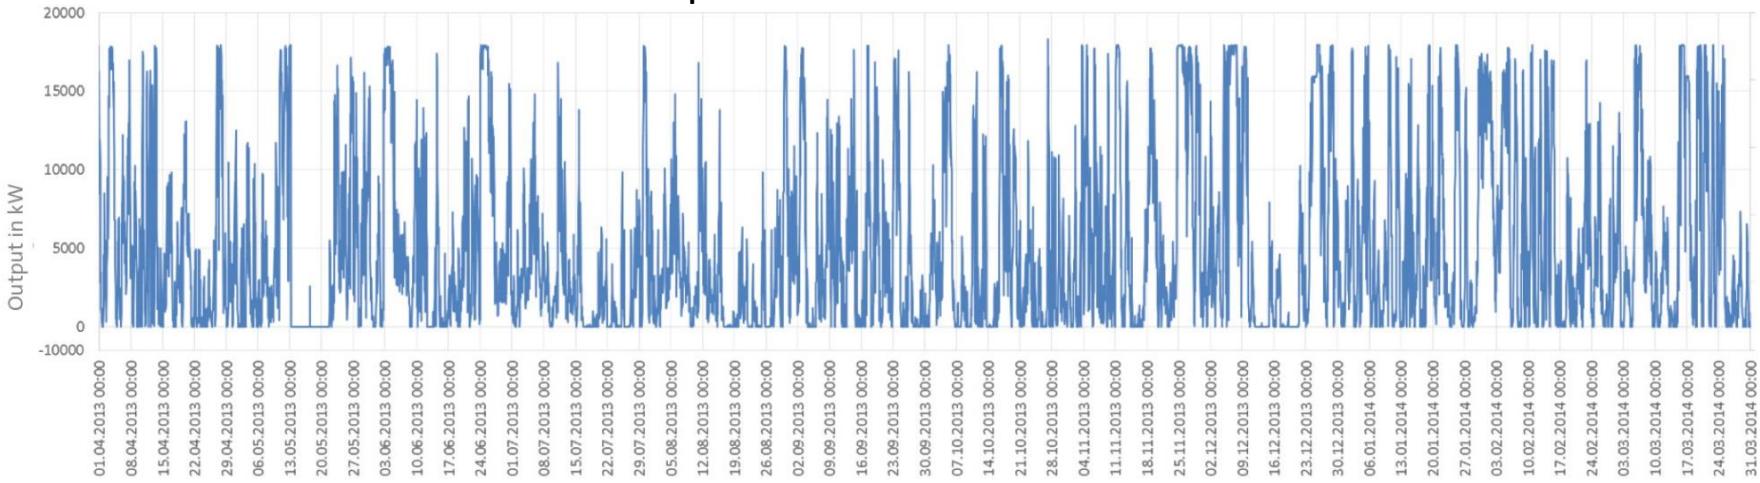

Source: Energy Charts, Fraunhofer ISE, 2017

Thermal storage of peak loads within the building structure by

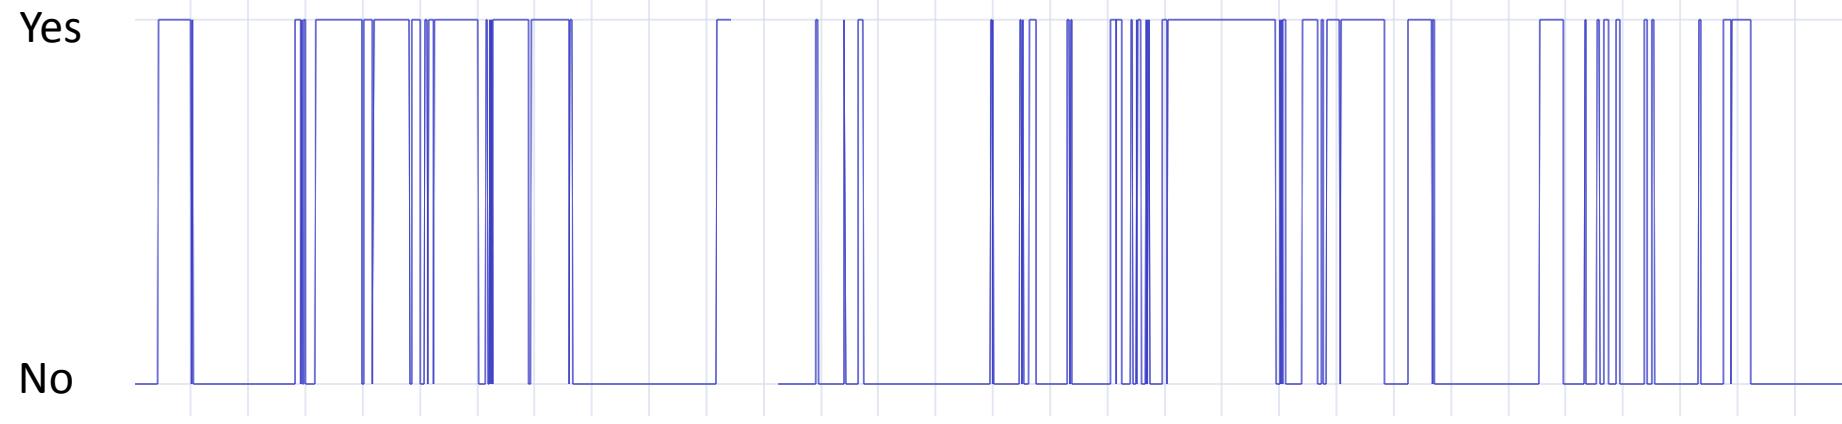

- activation of massive building parts in
- nearly zero energy buildings with energy supply
- via heat pump linked to the grid

April 2013 - March 2014

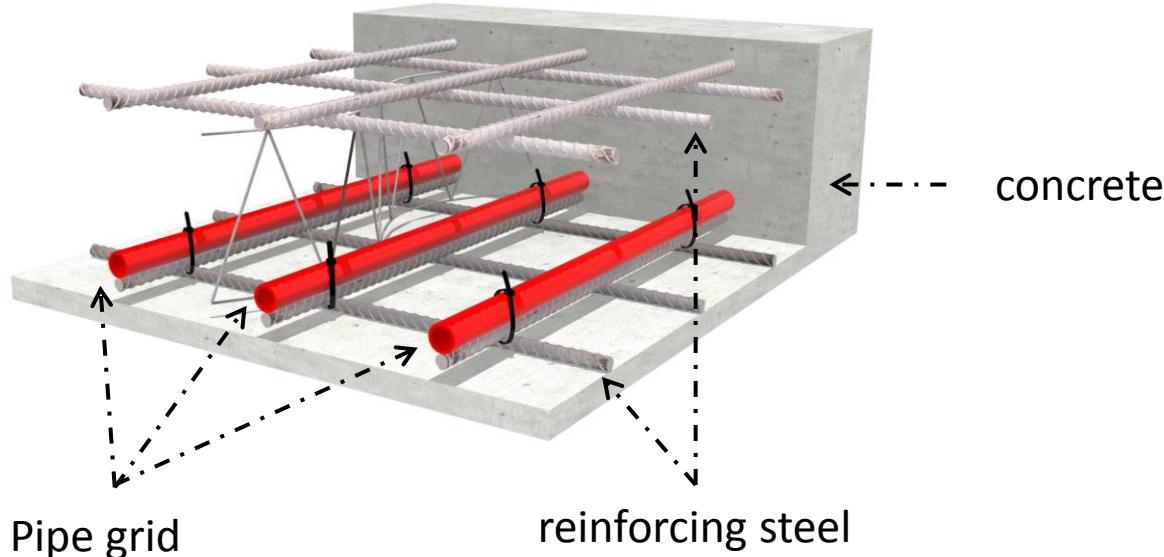

Available excess wind energy March 2017

High living comfort in the room

- Heating load $\leq 25 \text{ W/ m}^2$
- Cooling load $\leq 40 \text{ W/ m}^2$
- low surface temperatures
- heating medium $25 - 30 \text{ }^\circ\text{C}$

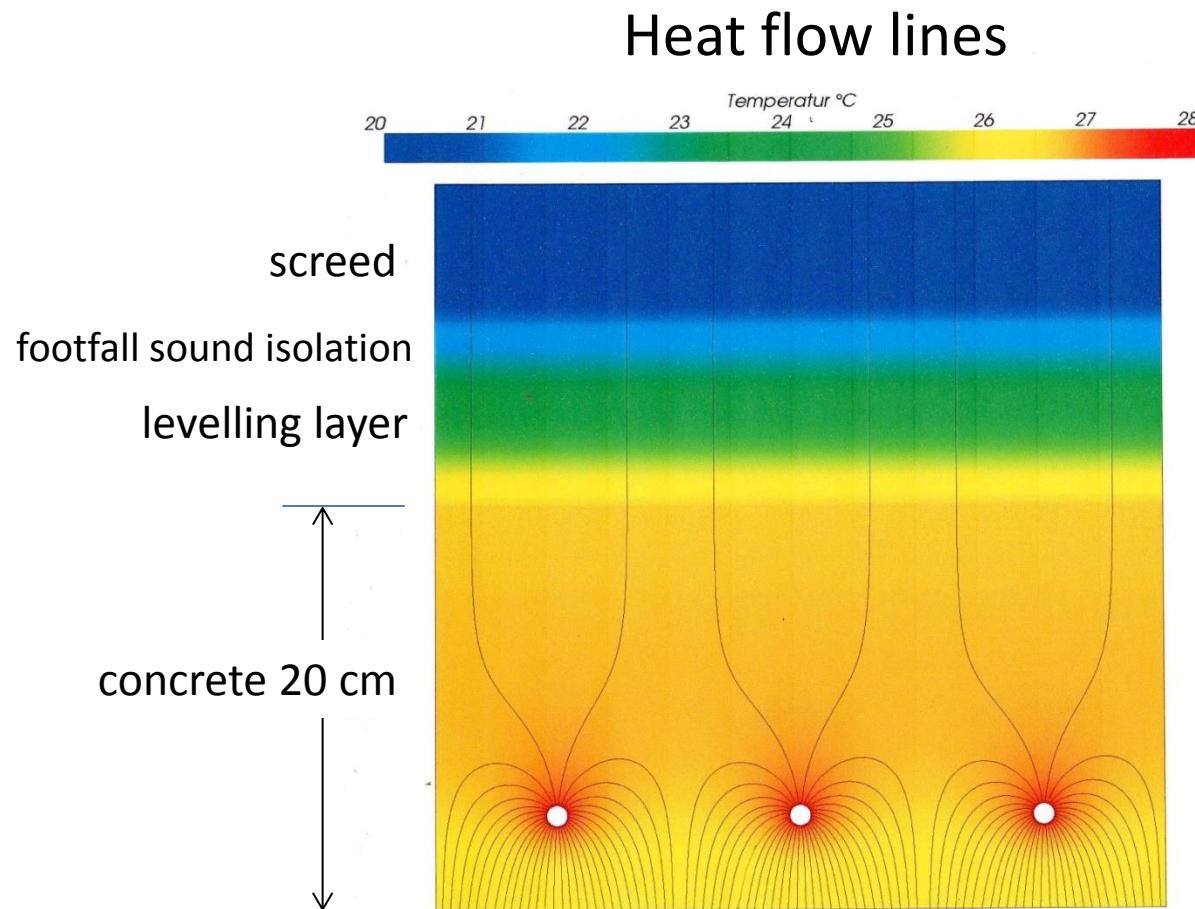

Why is concrete the material of choice? **“Concrete feels cold - thank God!”**

It is the combination of:

- high heat conductivity [2,5 W/mK]
- high specific gravity [2.400 kg/m³]
- high heat storage capacity [1 kJ/kgK]

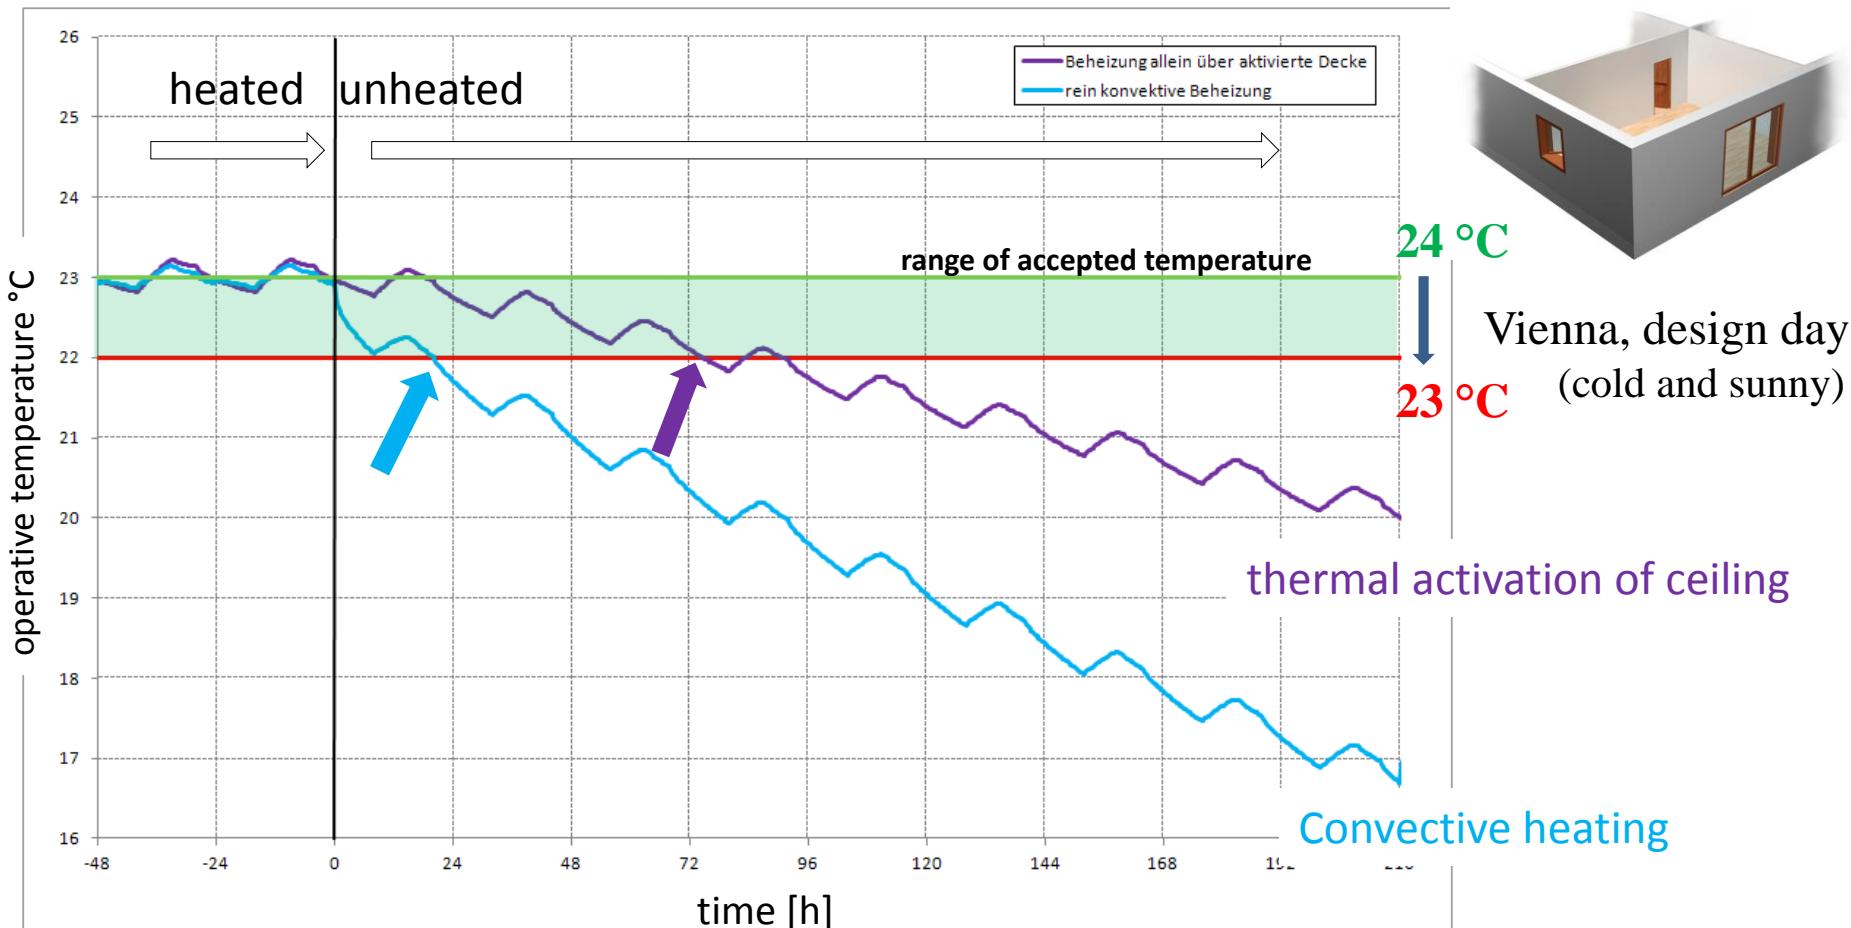

- **the effective areal storage capacity [kJ/m²K] is the decisive property!**

No change of the standard ceiling structure!

The major part of heat released by the pipe register flows to the room below the ceiling

Utilisation of excess peak electricity via concrete structures

- One family house close to Vienna, ca. 120m² living area
- **Construction** | mid-July 2015 to mid- December 2015

Objectives

- Energy supply solely via heat pump:
- Excess peak electricity from wind power - Ground collector
- Simplest possible Heating/cooling System
- Simplest possible control
- Most economic solution

Partners

Planning of the building services | FIN – Future Is Now, Kuster Energiesolutions GmbH

Supporting research | Univ.-Prof. Dr. Klaus Kreč , TU Wien | Dr. Simon Handler, Allplan

Partner wind energy: Roman Prager, W.E.B. wind energy company, Austria

Cement Industry: Dipl.-Ing. F. Friembichler, Dipl.-Ing. S. Spaun, VÖZ

Promising results for the first winter 2016/2017

„**70 % of the heating demand from renewable and surplus wind *) energy**“

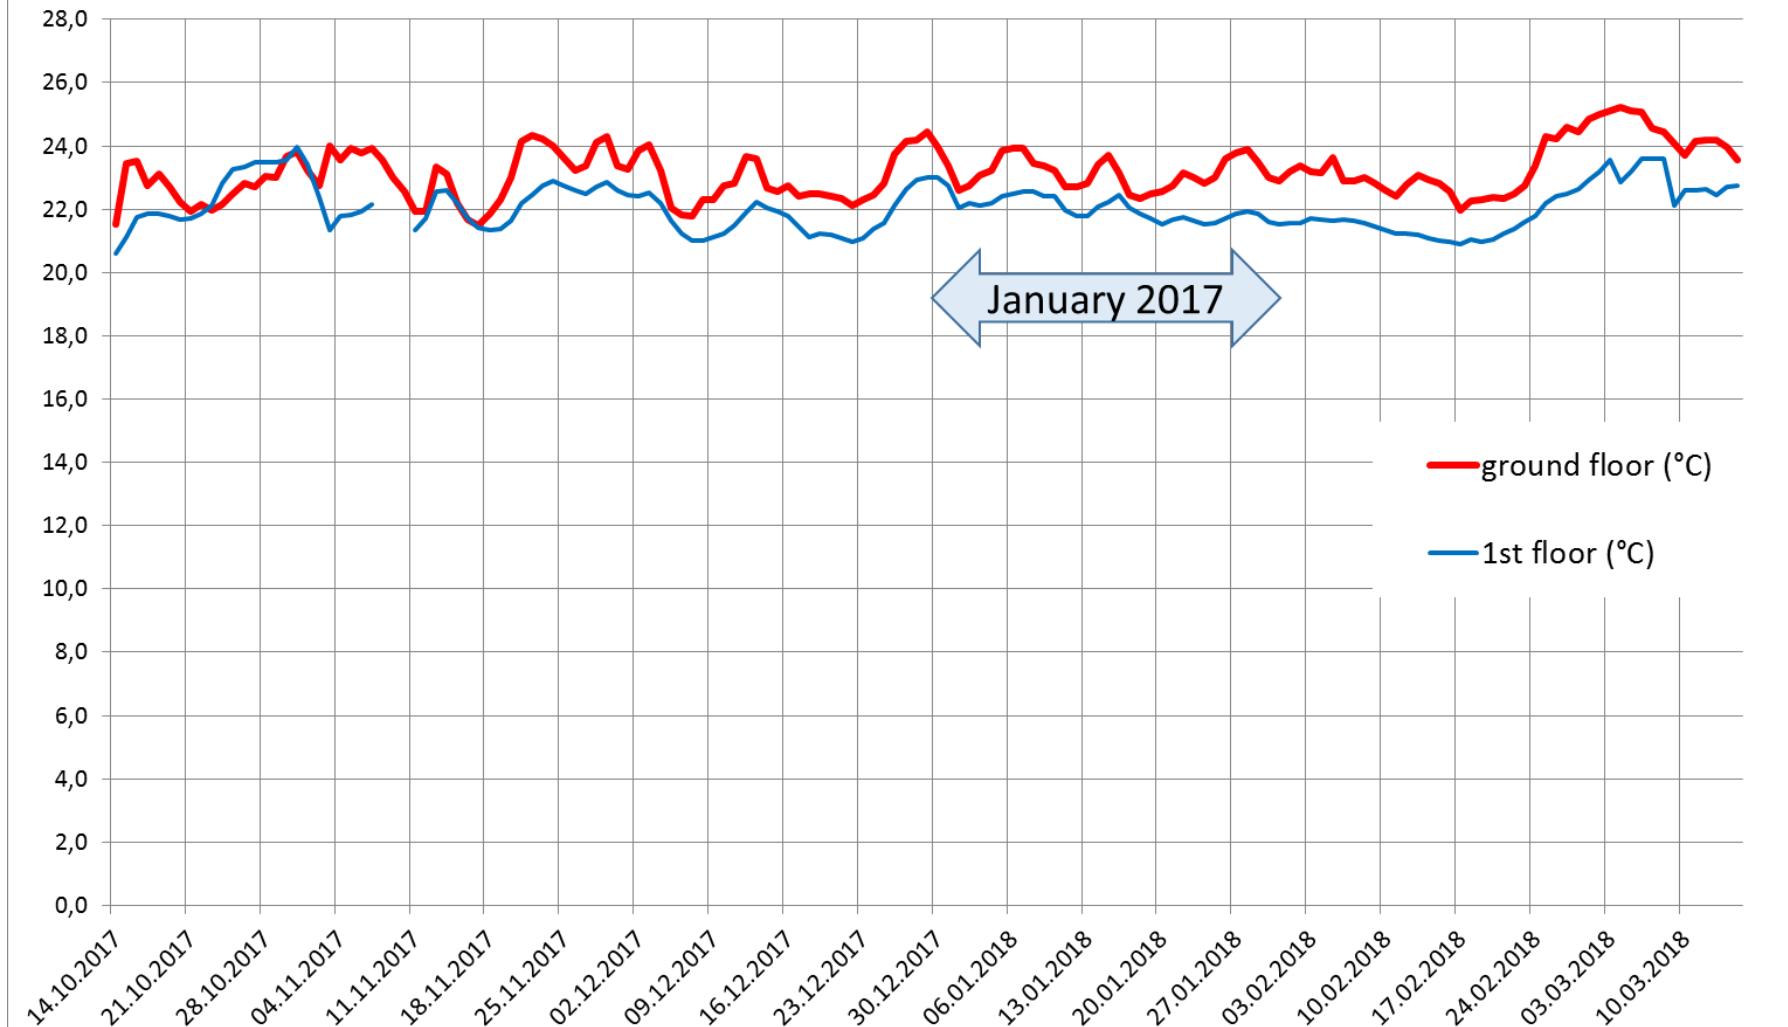

93% in November 2016 (steady winds)

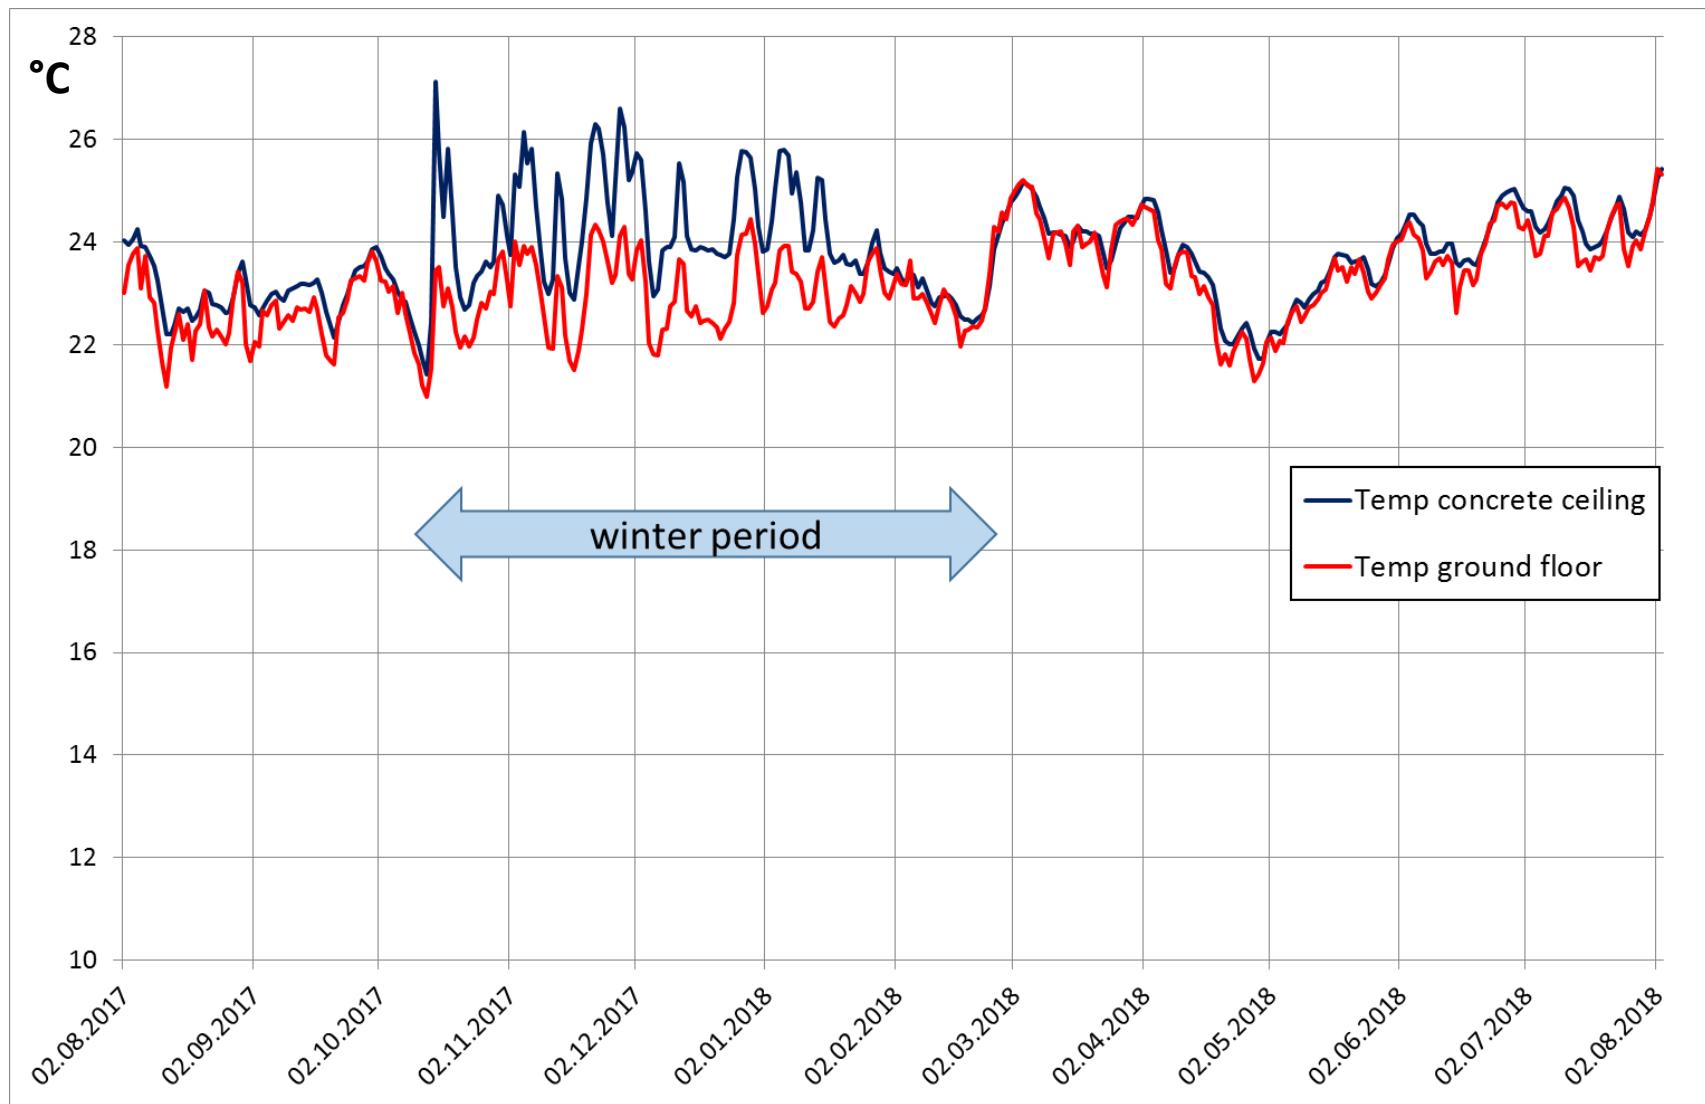

63% in January 2017 (coldest since 30 years!)

Expecting >> 80 % (mean) in the second monitoring year
(improving the air-tightness, dry building fabric)

*) one single wind park

winter 2016/2017

Vienna: Multi-family house (155apart.)

Source: www.wohnen.at/angebot/objekt-detail/?id=223

Construction starts end 2017

Vienna: Apartment house (14 apart.)

Construction starts 11/2017

- Wellbeing and thermal comfort through the use of efficient radiant heat
 - No (dust) turbulences
 - Uniform heat distribution
 - Ecologically cooling possibility
- Use of ambient heat and renewable energy sources
- Heating and cooling and buffering with a single system
- Independent of urban space conditions
- No additional construction measures
- Almost no additional costs for efficient buildings

Thank you for the support!!
