

Smart Grid

Peter Caldera

Lantiq Austria

Peter.Caldera@lantiq.com

22. Juni 2010

Wer wir sind:

- ... wurde im November 2009 gegründet.
- ... hat 900 Mitarbeiter (100 in Österreich)
- ... ist ein Fabless Unternehmen
- ... bietet Breitband-Kommunikation auf Basis von analogen, digitalen und Mixed-Signal-ICs sowie entsprechende Software an.
- ... ist Entwickler drahtloser Kommunikationslösungen.

Vortragender:

Dr. Peter Caldera

Leiter der Systementwicklung für Kommunikationssysteme bei Lantiq in Villach .

Peter.Caldera@lantiq.com

Smart Grid Austria - Status

- Technologieplatform
 - Start vor 2 Jahren als Projekt des BMVIT
 - Seit 2010 sind FEEI & VEO Träger der Plattform
- Ziel: Erstellung einer Technologieroadmap
 - Bereits im finalen Entwurfsstadium → geplante Fertigstellung Juni 2010
- 5 Arbeitsgruppen für die Umsetzung der Technologieroadmap
 1. Normung und Standardisierung
 2. Rahmenbedingungen (Gesetze, Regulierung, Förderungen)
 3. Daten
 4. Use-Cases / Geschäftsmodelle
 5. Umsetzung / Modellregionen

Smart Grid Austria - Standardisierung

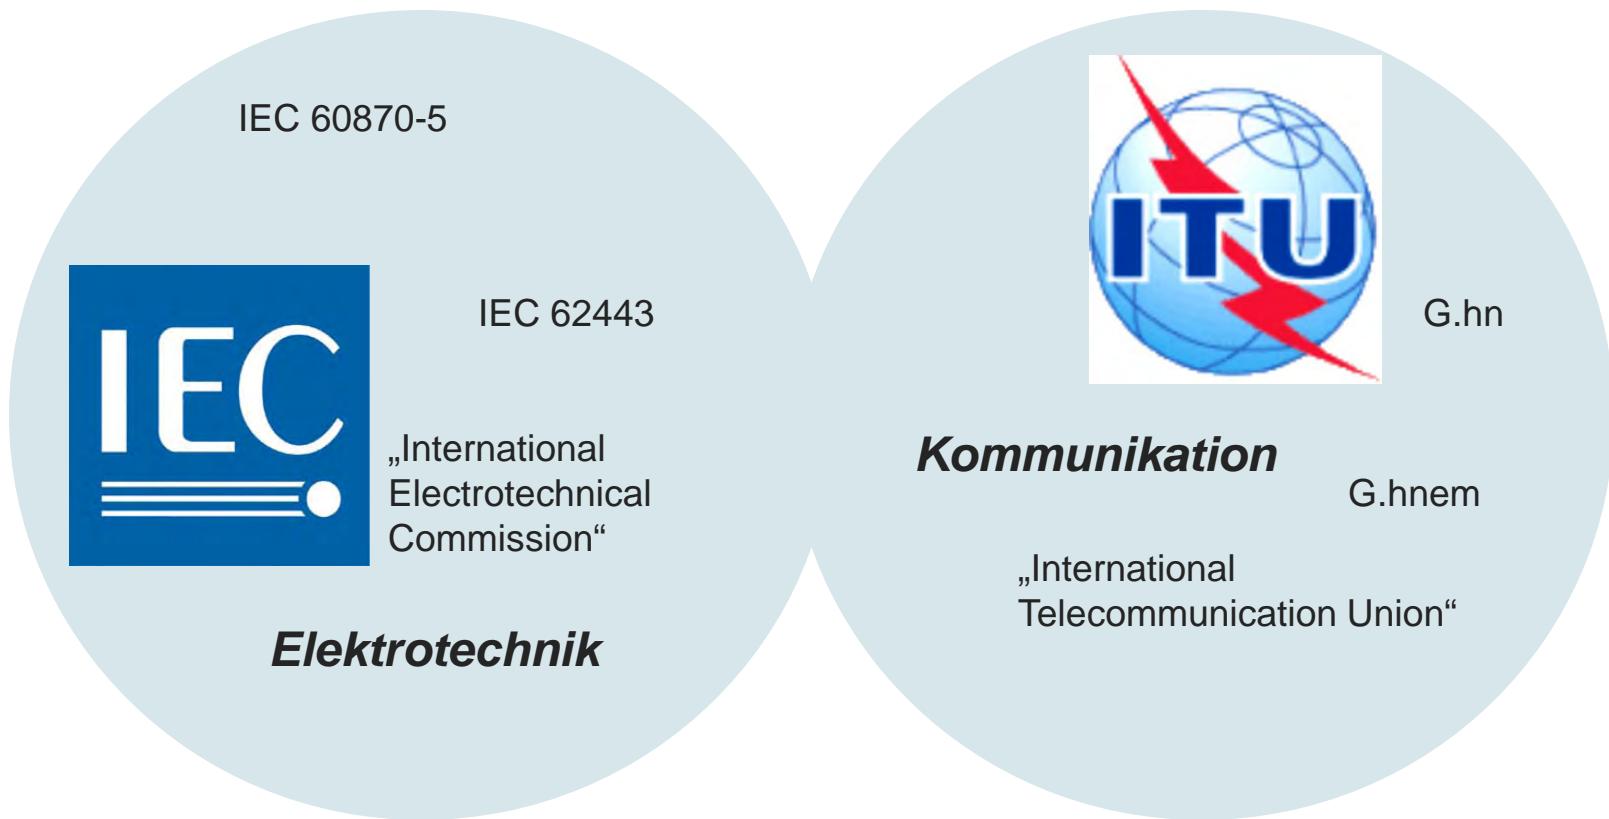

- Zieldefinition
 - Wir verfolgen Standardisierung mit den Zielen
 - Überblick Smart Grid relevanter Standardisierungsaktivitäten
 - Beobachtung von Aktivitäten und Erkennen von Trends
 - Definition gemeinsamer Interessen
 - Kontribution zu study groups und Fördergremien
- Themenvorschläge
 - Aufbau eines Know-how Pools
 - Kommunikation: Verfahren (G.hnem), Protokolle (TR69), Schnittstellen
 - Daten: Formate (XML, EDIFACT)
 - Netze
 - Expertenrunden und Infoveranstaltungen
 - Abstimmung mit ÖVE und E-Control

Smart Grid Austria - Standardisierung

■ Nächste Schritte

- Zusammenstellung und Verteilung aller wichtigen Standards
- Identifikation der für Ö wichtigen Themengebiete
- Aufbereitung detaillierter Information zu diesen Themen
- Präsentation der Ergebnisse bei einem SGA Meeting

Standardisierungsgremien

[Smart Grid Austria - Standardisierung]

- We need to contact many TCs, SCs and industry groups to make an ecosystem around us to minimize unnecessary competition.

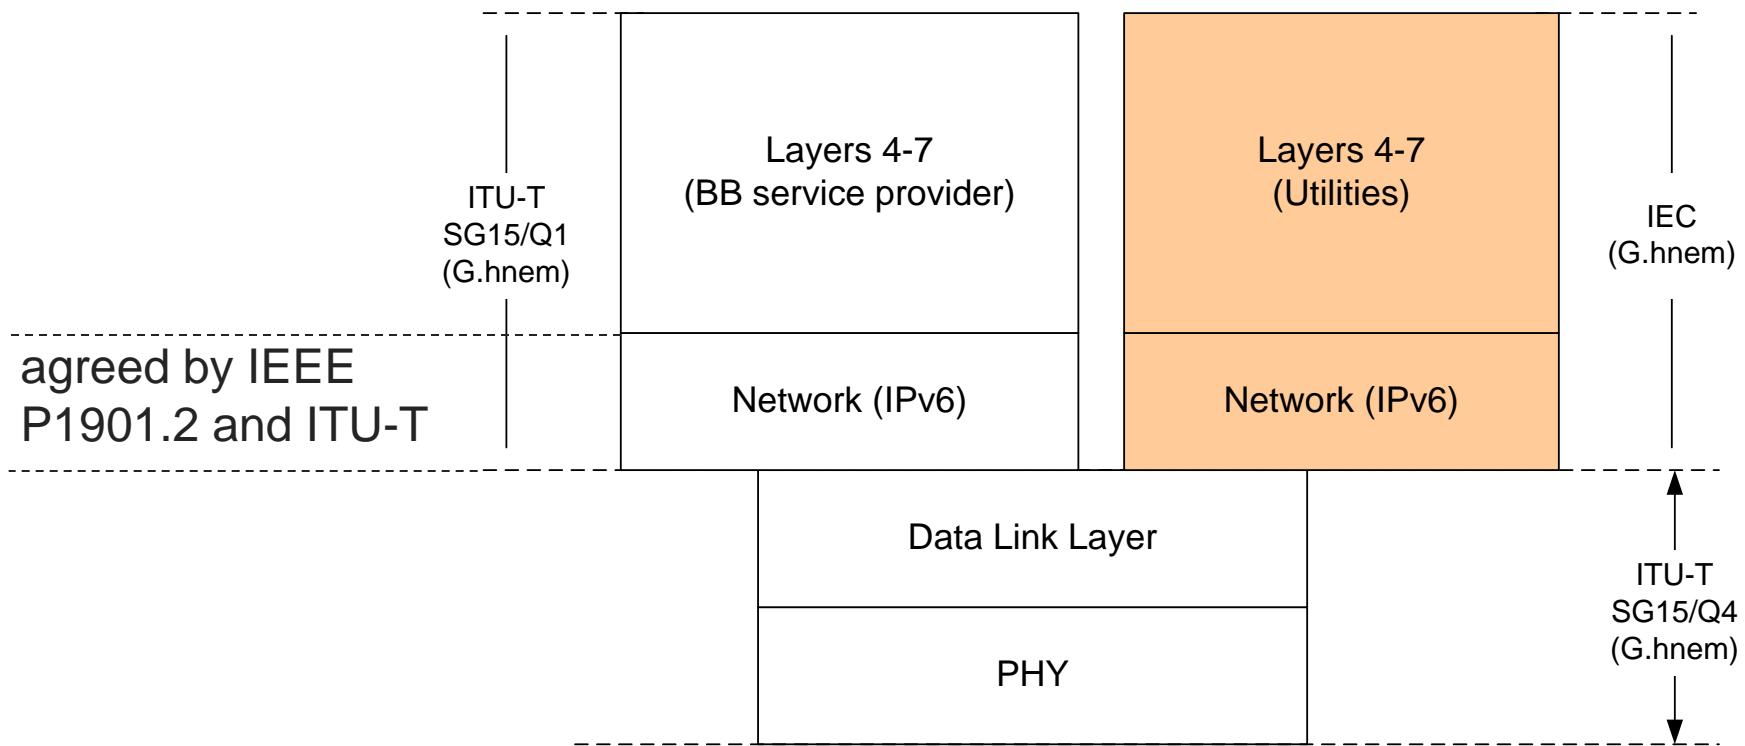

Greg Jones
ITU-T Communications Coordinator
International Telecommunication Union

Backup

- Standards (IEC & ITU)
- G.hnem: Background and potential cooperation with IEC

Cooperation between different groups

The figure below illustrates one great way of partitioning: three entities work together cooperatively on G.hnem / Zigbee

Standards

- **IEC**
 - **IEC 60870-5** “Telecontrol equipment and systems”
communication profile for sending basic telecontrol messages between two systems, which uses permanent directly connected data circuits between the systems.
 - **IEC 62443** “Industrial communication networks - network and system security”
Security
- **ITU**
 - **G.hn** “HomeGrid Standard”
new home network technology standard, that supports networking over several communication technologies with data rates up to 1 Gbit/s
 - **G.hnem** “Home Networking Aspects of Energy Management”
low complexity home networking devices for home automation, home control, electrical vehicles, and Smart Grid applications.
- ***die Regulierung muss für neue Standards offen sein!***

G.hnem Background

- G.hnem is the narrow-band PLC technology intended for energy management applications for in-home and utility (AMI)
- The in-home part is connected to and registered with the utility provider, but also can be accessed by the Broadband service provider
- Protocol stack: Full OSI model (layers 1 to 7)
- Main parameters:
 - Frequency range: 3-534 kHz (all CENELEC bands and FCC band)
 - Modulation: OFDM, up to 256 sub-carriers
 - Media access: CSMA/CA
 - Layer 3 protocol: IPv6 (main)
 - Layers 4-6: under development
- For PHY/MAC, both in-home part and utility access part will be addressed

G.Hnem foundation and development

- Founded Jan 2010 to provide narrow-band low frequency PLC solution for in-home energy management and AMI, but also home automation and other low-speed low complexity applications.
- Development team:
 - ITU-T SG15/Q4 – PHY and Data Link Layer (DLL)
 - ITU-T SG15/Q1 in cooperation with IEC – all upper layers
 - Many contributors are invited
- Goal to consent Feb 2011
- Convergence between PHY/DLL and other layers:
 - DLL to L3 and addressing scheme = 6LoWPAN
 - Network layer (L3) = IPv6
 - L4-L7 – under development

Sharing the work between different groups

- SG15/Q4 is at the advances stage of PHY/MAC spec development – the current draft already includes 56 pages
- SG15/Q1 got OK to develop a spec that will address L3 and above for communications between Broadband access and energy management network (BB service provider access)
- The most important part of G.hnem project is communication with Utilities – this part still has no particular owner.
- If IEC will take care about upper layers of G.hnem protocol stack related to utilities, it will make G.hnem development properly shared and complete soon in good cooperation from different sides – not the case right now.
