Renewable Energy Directive (RED)

Sustainability criteria for biofuels

- Minimum GHG emission savings (Art. 17.2)
 - 35%
 - for installations that were in operation on 23 January 2008:
binding from 1 April 2013
 - 2017 50%
 - 2018 60% for new installations
- Economic operators may use (Art. 19.1)
 - default values
 - actual values calculated according to Annex V.C
 - sum of actual value and disaggregated default value
- Independent auditors must check information (Art. 18.3)
- Can be part of voluntary certification schemes (Art. 18.4)

RED Annex V.a

A. Typical and default values for biofuels if produced with no net carbon emissions from land-use change

Biofuel production pathway	Typical greenhouse gas emission saving	Default greenhouse gas emission saving
sugar beet ethanol	61 %	52 %
wheat ethanol (process fuel not specified)	32 %	16 %
wheat ethanol (from CHP plant)	32 %	16 %
conventional ethanol	45 %	34 %
ethanol from sugar cane	53 %	47 %
ethanol from sugar cane (as is)	69 %	69 %
ethanol from sugar cane (as is)	56 %	49 %
ethanol from sugar cane (as is)	71 %	71 %
the part from renewable sources of tertiary-amyl-butyl-ether (ETBE)	Equal to that of the ethanol production pathway used	
the part from renewable sources of tertiary-amyl-ethyl-ether (TAAE)	Equal to that of the ethanol production pathway used	
rape seed biodiesel	45 %	38 %
sunflower biodiesel	58 %	51 %
soybean biodiesel		31 %
palm oil biodiesel (process not specified)		19 %
palm oil biodiesel (process with manure capture at oil mill)		16 %
waste vegetable or animal (?) oil biodiesel		%
hydrotreated vegetable oil from rapeseed		%
hydrotreated vegetable oil from sunflower		12 %
hydrotreated vegetable oil from palm oil		26 %
hydrotreated vegetable oil from palm oil (process with manure capture at oil mill)		65 %
pure vegetable oil from rape seed	58 %	57 %
biogas from municipal organic waste as compressed natural gas	80 %	73 %
biogas from wet manure as compressed natural gas	84 %	81 %
biogas from dry manure as compressed natural gas	86 %	82 %

Ethanol form sugar beet

Typical savings: 61%

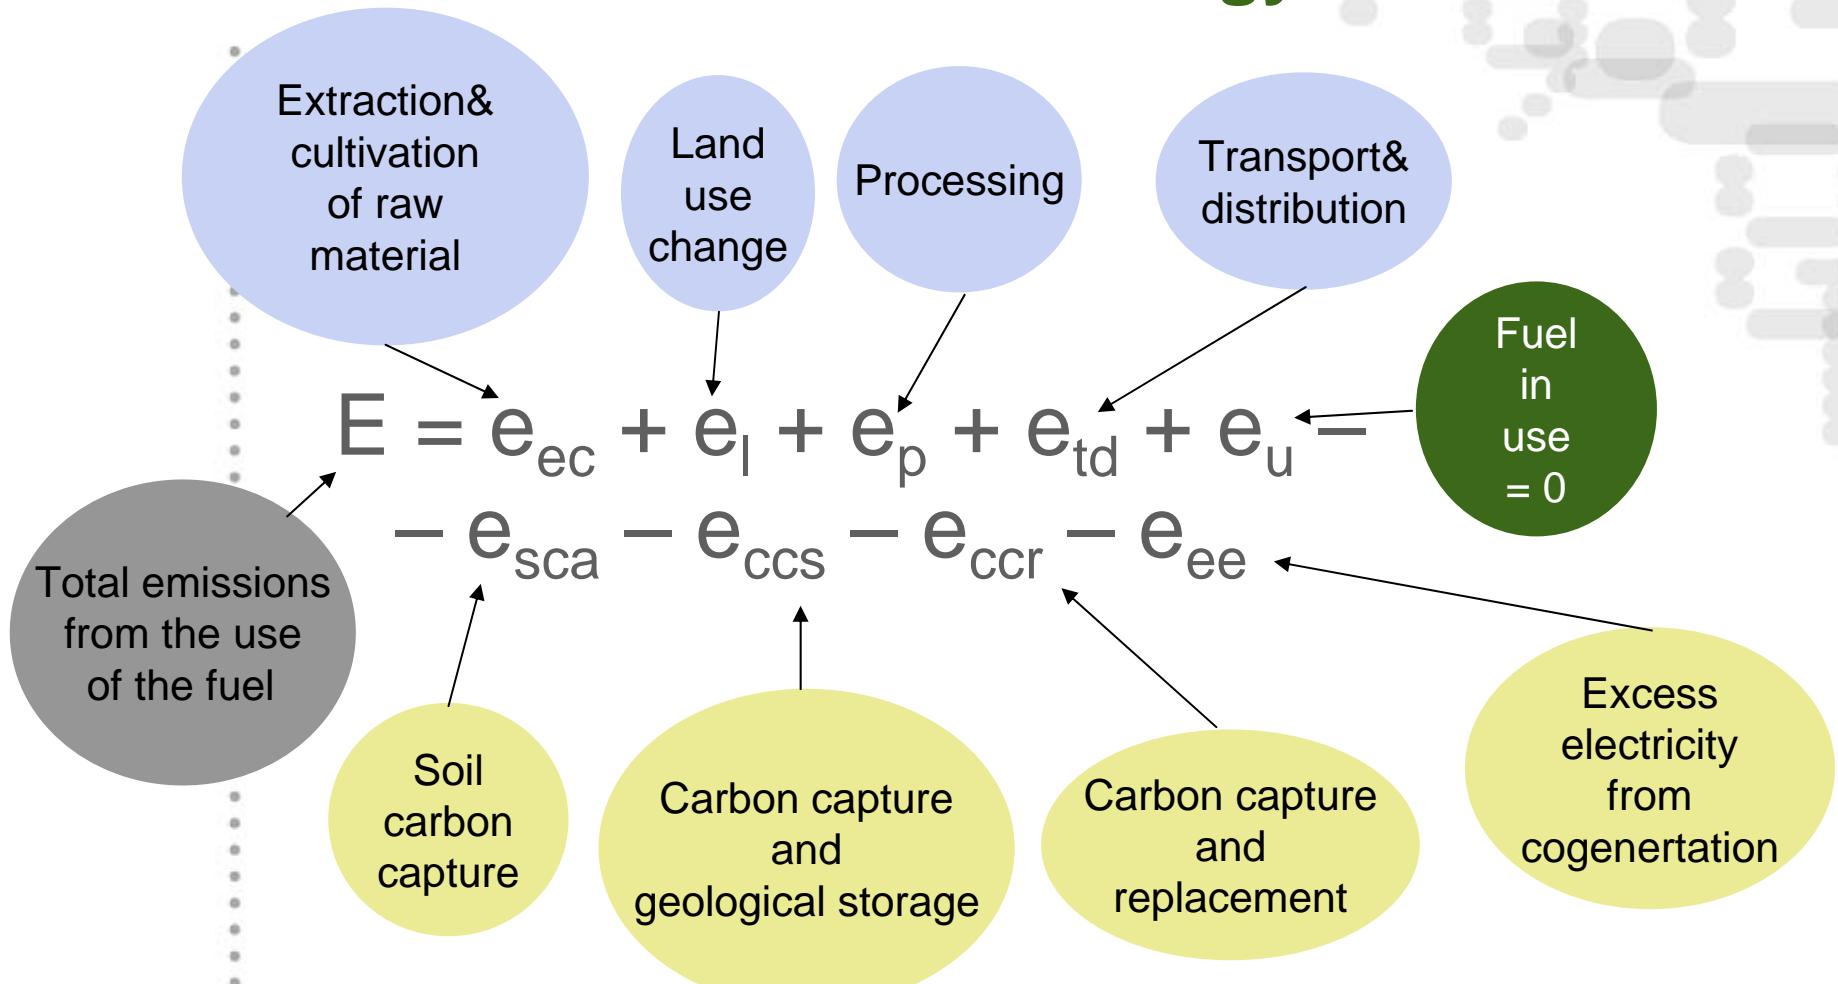

Default value: 52%

Rape seed biodiesel

Typical savings: 45%

Default value: 38%

RED Annex V.c: Methodology

Why harmonisation of biofuel GHG calculations?

- o Input data
- o Standard values ("conversion factors")

Cultivation of rapeseed		Calculated emissions			
		Emissions per MJ FAME			
		g CO ₂	g CH ₄	g N ₂ O	g CO ₂ , eq
Yield					
Rapeseed	3.113 kg ha ⁻¹ year ⁻¹				
Moisture content	10,0%				
By-product Straw	n/a kg ha ⁻¹ year ⁻¹				
Energy consumption					
Diesel	2.963 MJ ha ⁻¹ year ⁻¹	6,07	0,00	0,00	6,07
Agro chemicals					
N-fertiliser	137,4 kg N ha ⁻¹ year ⁻¹	9,08	0,03	0,03	18,89
CaO-fertiliser	19,0 kg CaO ha ⁻¹ year ⁻¹	0,05	0,00	0,00	0,06
K ₂ O-fertiliser					
P ₂ O ₅ -fertiliser					
Pesticides					
STANDARD VALUES		parameter:	GHG emission coefficient		
		unit:	gCO ₂ /kg	gCH ₄ /kg	gN ₂ O/kg
N-fertiliser			2827,0	8,68	9,6418
Seeding material			5880,6		
Seeds- rapeseed		6 kg ha ⁻¹ year ⁻¹	0,06	0,00	0,00
			0,10		

Why harmonisation of biofuel GHG calculations?

- EXAMPLE: Different results from same biofuel
(same input values but different standard values)

Production of FAME from Rapeseed

Overview Results

Parameter

Nitrogen Fertilizer
P fertilizer
K fertilizer
CaO fertilizer (85%CaCO₃+15%CaO,Ca(OH)₂)
Pesticides
Diesel (direct plus indirect emissions)
Natural gas (direct plus indirect emissions)
Methanol (direct plus indirect emissions)

Production of FAME from Rapeseed

Overview Results

All results in g CO _{2,eq} / MJ FAME	Total	Default values RED Annex V.D	Emission reduction
Cultivation e_{ec}	27,7	29	Fossil fuel reference (diesel) 83,8 g CO _{2,eq} /MJ
Cultivation of rapeseed	27,29	28,51	GHG emission reduction
Rapeseed drying	0,42	0,42	46%
Processing e_p	16,5	22	
Extraction of oil	3,29	3,82	
Refining of vegetable oil	0,85	17,88	
Esterification	12,39		
Transport e_{td}	1,3	1	
Transport of rapeseed	0,15	0,17	
Transport of FAME	0,73	0,82	
Filling station	0,44	0,44	
Land use change e_l	0,0	0	
e _{sca} + e _{ccr} + e _{ccs}	0,0	0

Condensed list of standard values, version 3 - Public

This file gives the standard values as published on www.biograce.net in Word format.

Two Word versions of this list exist:

1. A complete list of standard values, containing all the values as listed in the Excel version
2. A condensed list showing the most important standard values

This file contains the condensed list.

Abbreviations and definitions used can be found in the Excel file on the web page

<http://www.biograce.net/content/ghgcalculationtools/standardvalues>.

1 Global Warming potentials

Commission sets up system for certifying sustainable biofuels

The Commission decided on 10 June 2010 to encourage industry, governments and NGOs to set up certification schemes for all types of biofuels, including those imported into the EU. It laid down what the schemes must do to be recognised by the Commission. This will help implement the EU's requirements that biofuels must deliver substantial reductions in greenhouse gas emissions and should not come from forests, wetlands and nature protection areas. The rules for certification schemes are part of a set of guidelines explaining how the Renewable Energy Directive, coming into effect in December 2010, should be implemented.

One list of standard values

- European Commission makes reference to list
- Member States include list in Technical Guidance:
 - Austria, Sweden, UK are preparing to do
 - Germany, Ireland, Netherlands are about to decide to do so
- Example (from UK consultation on C&S Technical Guidance)
 - *The RFA therefore proposes the following approach to which standard values should be used:*
 1. *For the reporting period 2011/2012, the RFA proposes to align its current standard emission factors with the ones proposed by the BioGrace project.*

Harmonised Calculations of Biofuel Greenhouse Gas Emissions in Europe

Production of Ethanol from Sugarcane

Overview Results

All results in g CO ₂ /MJ ethanol	Non-allocated results	Allocation factor	Allocated results	Total
Cultivation of sugarbeet	16.08	71.3%	11.46	11.5
Processing	36.82	71.3%	26.26	26.3
Transport	1.11	71.3%	0.79	2.2
Land use change	0.6	71.3%	0.44	0.6
Totals	55.6	100%	40.1	40

Default values RED Annex V.D

Allocation factors	Emission reduction
Ethanol plant	71.3% to ethanol 28.7% to Sugar beet pulp
Final fuel reference (petrol)	83.8 g CO ₂ /MJ
GHG emission reduction	52%

Calculations in this Excel sheet.....

- strictly follow the methodology as given in Directives 2009/28/EC and 2009/30/EC
- follow JRC calculations by using LCI999 values 25 for CEM and 298 for NSO as explained in "About" under "improved use of training"

Calculation per phase

Cultivation of sugarbeet

Yield	Quantity of product	Calculated emissions	Info
Sugar beet	280.825 MJ/sugarcane ha ⁻¹ year ⁻¹	Emissions per MJ ethanol g CO ₂ g CH ₄ g N ₂ O g CO ₂ eq	per kg sugarbeet g CO ₂ /kg per ha, year kg CO ₂

Additional tools

- User manual
 - rules for making calculations of actual value
 - extra sheets for calculation of
 - direct land use change (based on Commission Decision)
 - N₂O emissions (based on IPCC Tier 1)
 - list of recommended standard values
- **BioGrace will not:**
- add pathways to the Excel file with GHG calculations that are not listed in RED Annex V
 - help stakeholders make actual calculations
 - check actual calculations at the request of stakeholders

Recognition as a voluntary certification scheme

Observations:

- Current voluntary cert. schemes do not include GHG tool
 - ISSC, REDcert, NTA8080, RSPO, RTRS, Bonsucro (BSI)
- European Commission only allows use of GHG tool if it is recognised as a voluntary cert. scheme
- To our knowledge no GHG tools have been sent to Commission for recognition
 - Some schemes will be sent in, eg. National GHG tools
 - Information on actual developments is scarce
- GHG tool can be used as “add-on” to existing schemes

Time schedule

- Submit BioGrace tool to EC for recognition in March or April
- Recognition period of 5 years probably

Thank you for your attention
